

Task: Given a list of strings, return the longest string by length.

Correct CoT Prompt

You are given a list of strings. Return the longest string by character LENGTH. If multiple strings have the same maximum length, return any one of them. Provide Python code.

Correct Code

```
def longest_string_right(strings):  
    if not strings:  
        return ""  
    return max(strings, key=len)
```

Wrong CoT Prompt

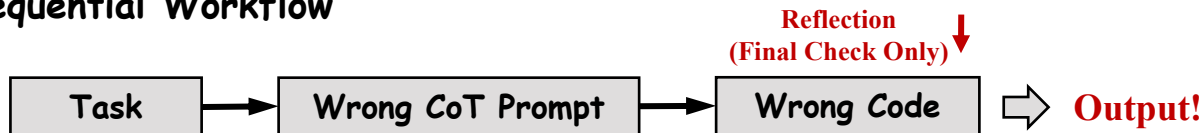

You are given a list of strings. Return the 'largest' string. Assume 'largest' refers to lexicographic order. Provide Python code.

*Misinterprets **longest** as lexicographically largest!*

Wrong Code

```
def longest_string_wrong(strings):  
    if not strings:  
        return ""  
    return max(strings)
```
